

STUDIO SETTINGS

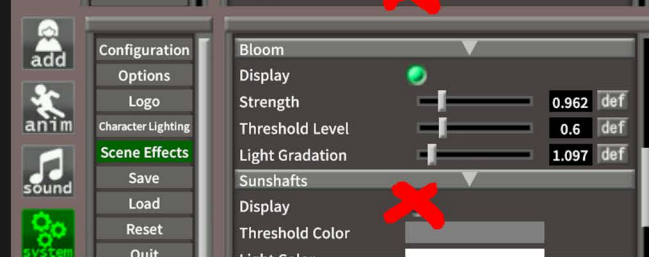

When I first start a scene, I make sure my shading is set to Live Concert Stage with light-medium ambient occlusion. Depth of field and Vignetting are never needed.

I keep my bloom strength a little bit above the default. This is the only value that really needs to be changed here.

When using KKUTS, I set my shadow density to 1 and the shadow color to black. Outline thickness stays above 0.3 with a density of about 0.8 - 0.9.

My scenes tend to favor the more natural sunny orange lighting rather than white. Move the color down diagonally and increase lighting strength as you go down. 1.11 is good for me.

KKUTS SHADOWS

1st_ShadeColor: R 0.75 G 0.75 B 0.75 A 1 Reset
2nd_ShadeColor: R 0.8437504 G 0.7849162 B 0.7407902 A 1 Reset

1st_ShadeColor_Feather:* 0.0325217 Reset
1st_ShadeColor_Step:* 0.7059337 Reset
~~2nd_ShadeColor_Feather: 0.01 Reset~~
~~2nd_ShadeColor_Step: 1 Reset~~

I only adjust the 1st shade color values. The feather value is usually never higher than 0.033. You can adjust the step to whatever looks best for you. This is the equivalent of deep shadows and slight shadows in the vanilla shaders. Make sure these values are consistent with the clothes.

I don't bother adjusting the 1st shade color. The 2nd shade color is usually going to be a very light brown color. This is going to be the main shadow.

Material Editor Clothes Bra

Is_LightColor_Base: 1 Reset
Is_LightColor_HighColor: 1 Reset
Is_LightColor_MatCap: 1 Reset
Is_LightColor_RimLight: 1 Reset
Is_NormalMapForMatCap: 0 Reset
Is_NormalMapToBase:* 0 Reset
Is_NormalMapToHighColor:* 0 Reset
Is_NormalMapToRimLight:* 0 Reset

This is a preference, but I usually turn off the normal map for items and clothing that have complex normal maps. This makes the shadows look more smooth and anime like. This isn't needed for hair.

KKUTS HIGH COLOR

High color is completely optional, but you should always set the color value to a dark grey. Alternatively, you can set it to a color that's similar to the object's color but lighter.

You can control the softness of the high color with the specularToHighColor value. I personally set the value to 0 with a very slight high color.

KKUTS RIM LIGHT

No Rim Light

Rim Light

RimLight.*	0.4557445	Reset
RimLight_FeatherOff:	0	Reset
RimLight_InsideMask.*	0.8186803	Reset
RimLight_Power.*	1	Reset

I usually max out rim light and rim light power when using rim light. You can control the mask of the rim light using the insideMask value.

0.8 to 0.9 are good starter values for the mask.

If your object's rim light looks too strong, you can reduce the rim light value or change the color of the rime light so that it is a slightly lighter color than the object.

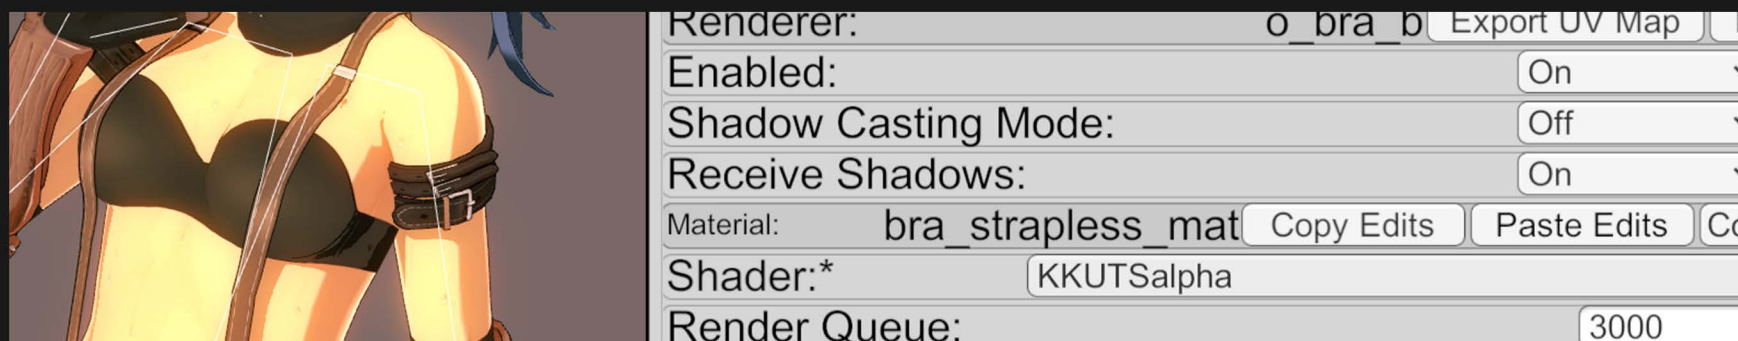

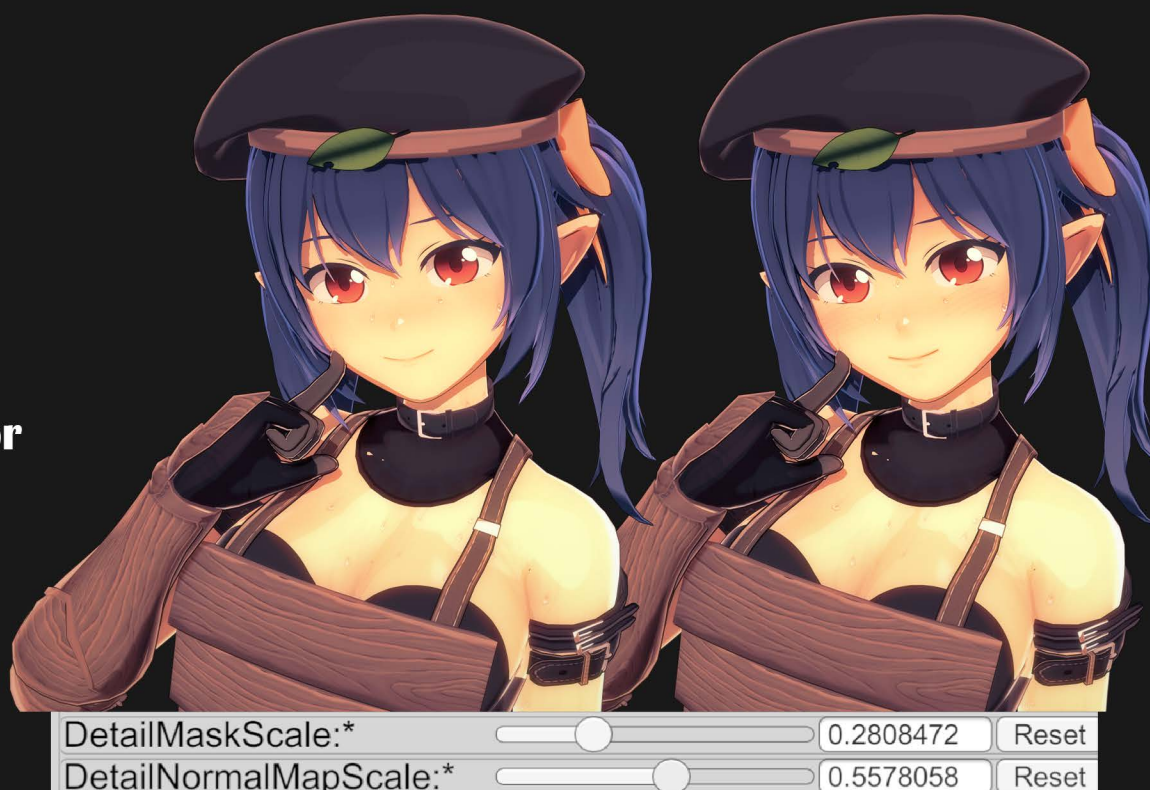

I use light blue rim light for blue hair here.

KKUTS EXTRAS

Sometimes you will get objects that have shadows that behave independently, you can fix this by switching the shader to KKUTShair.

Adjusting these values will increase the intensity of the detail mask. This is different for each object, but for the body and face, I like to keep the values low.

Skin tight bras and underwear should always use the KKUTSalpha shader. Otherwise you'll get really bad aliasing. Alpha shaders also don't have outlines.

KKUTS EXTRAS 2

BaseColor allows you to increase the color of the object while emissive color allows you to give it emissive light.

I use a very low emissive color that matches the color of the object. It can act sort of like an ambient light.

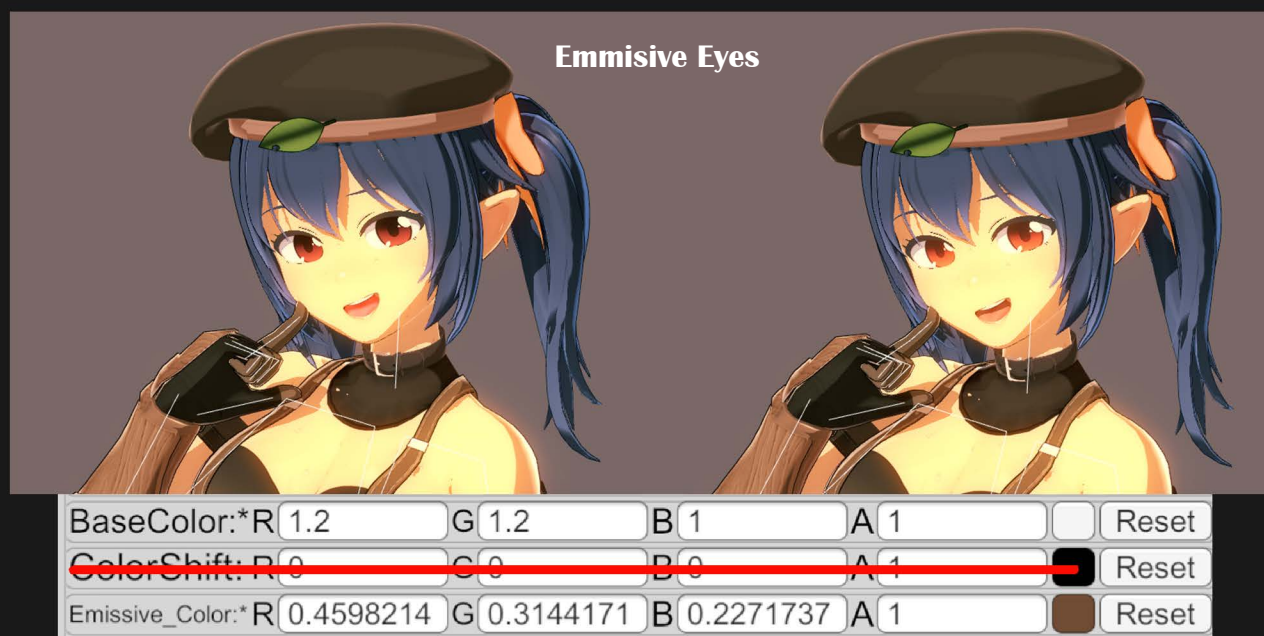

You can increase the lightness of an object by increasing the base color over the value of 1.

If you want to speed up your process, you can also “Copy Edits” your KKUTS shader and paste those edits on another object. Just make sure that the object you are copying does not contain an changed texture. I use this process for my hair and accesories as they tend to never use special textures.

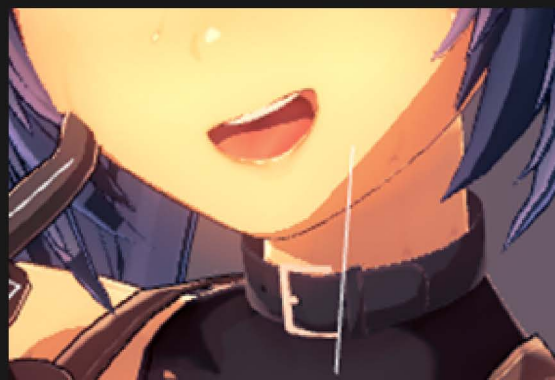

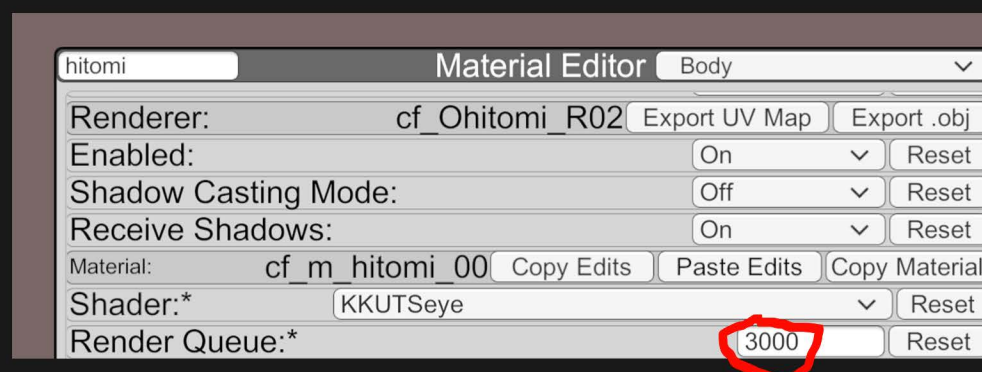

Hitomi(Eye) uses the KKUTSeye shader. You will need to change the render queue in order for it to work correctly. I use 3000.

Sirome(Eye Whites) and eyelashes all use KKUTSeyew.

You can also apply KKUTS to the tang(tongue) and tooth(teeth)!

You can also create glowing objects by increasing the emissive color to a value over 1.
For example, (R: 2, G: 2, B: 2)

After Effects

Once I'm done with everything. I like to go back over the studio settings and change it up a bit. This shading looks nice to me, and I've increased the ambient occlusion a bit.

I wanted to try a backlight shot, but I want the character's eyes to glow in the shadows.

Editing the 1st shadeColor Step on the hitomi and sirome allowed me to make that happen.
