

How to paint an .obj in Photoshop by gt9797.

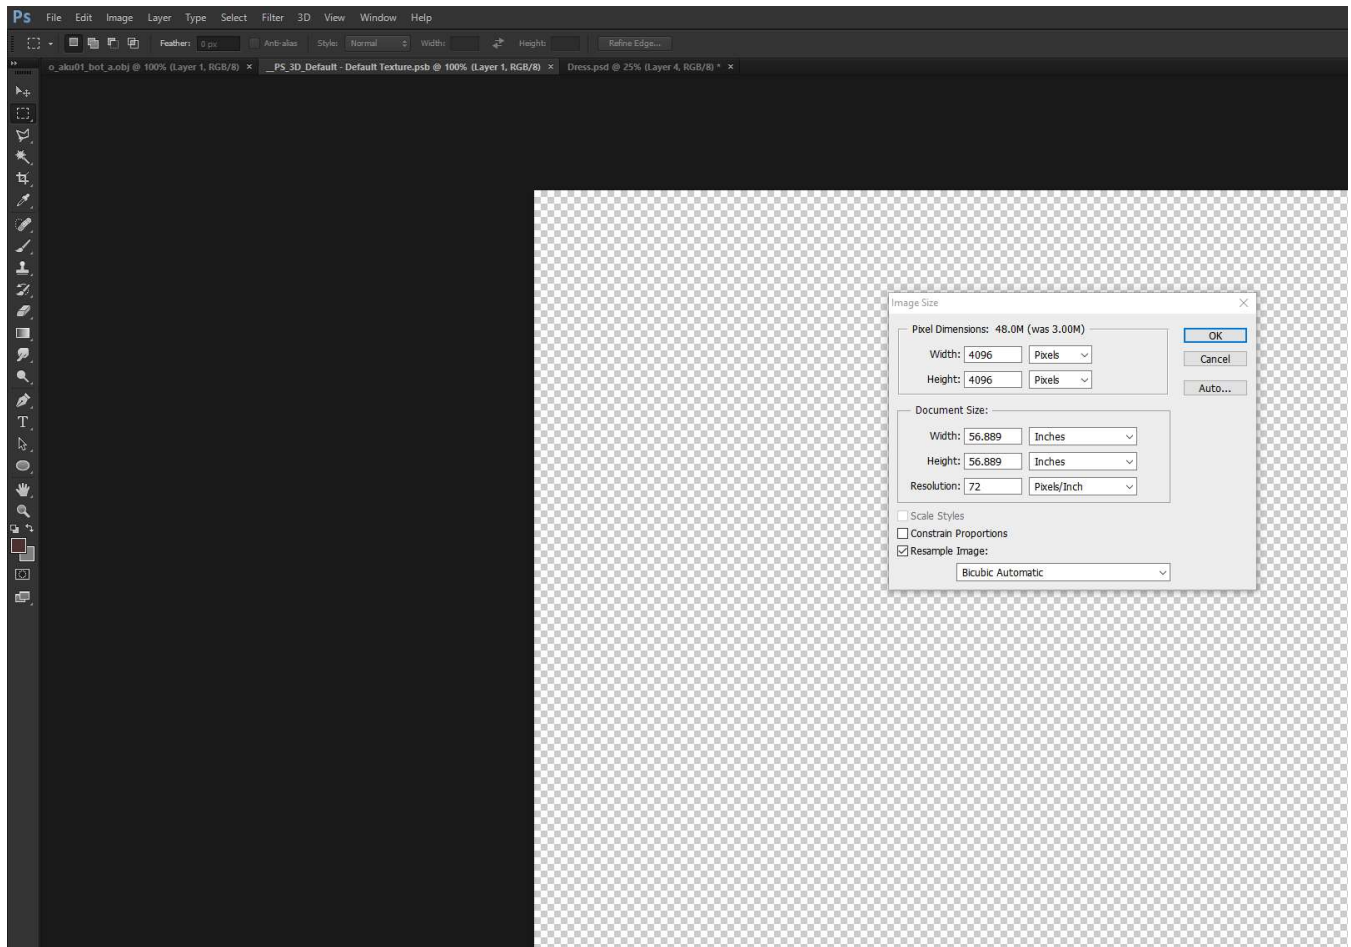

I made this guide for someone for a specific case in discord DMs but this should have the basics.

You first need to export the .obj with Material Editor. Then you can open it with Photoshop.

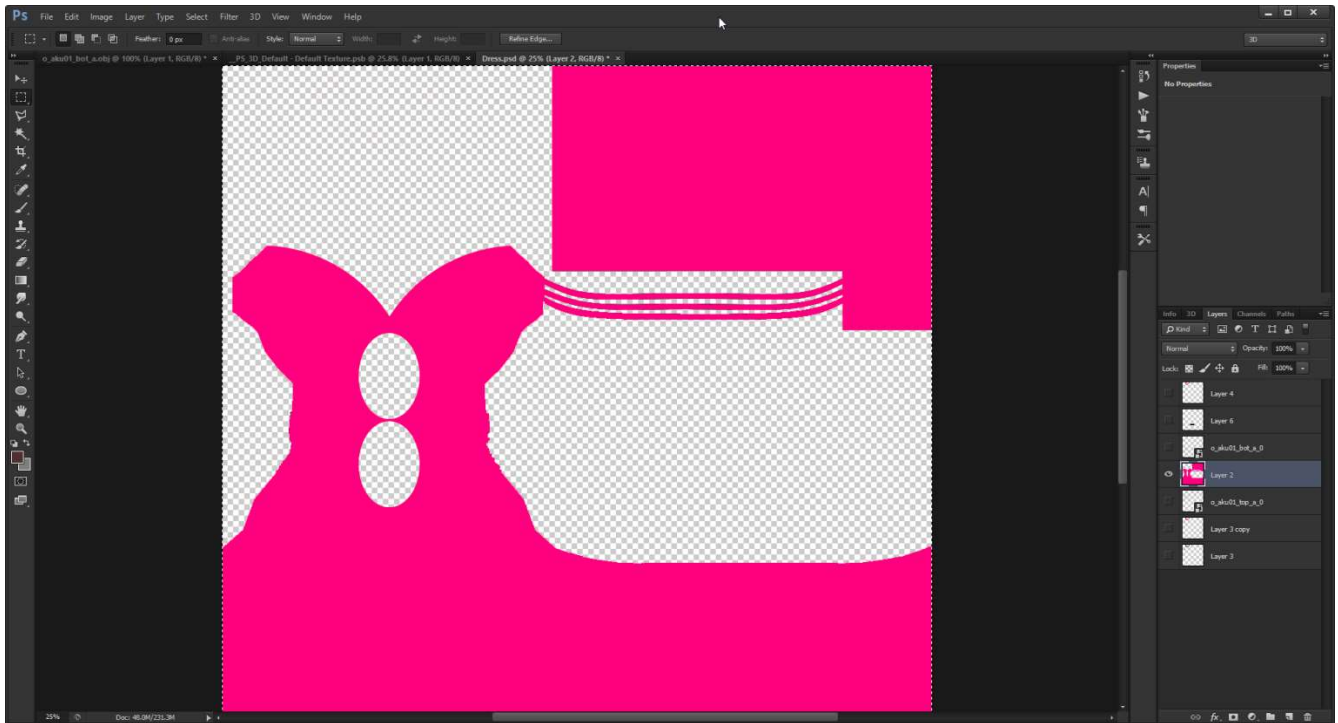

1. When you open the obj for first time, navigate here and change from 3d to layers. Double click `__PS_3D.....` to open the obj texture (now blank)

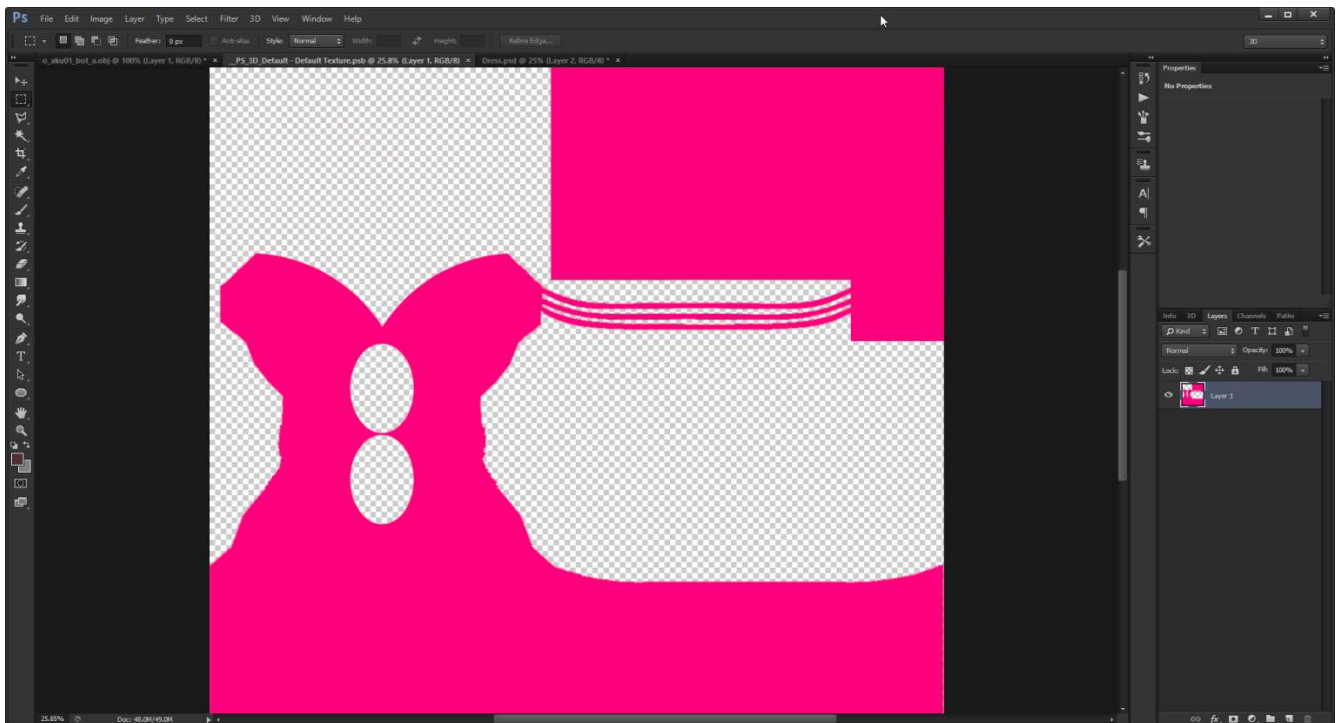

2. Double clicking above should bring open this image. Once open resize this texture to 4k.

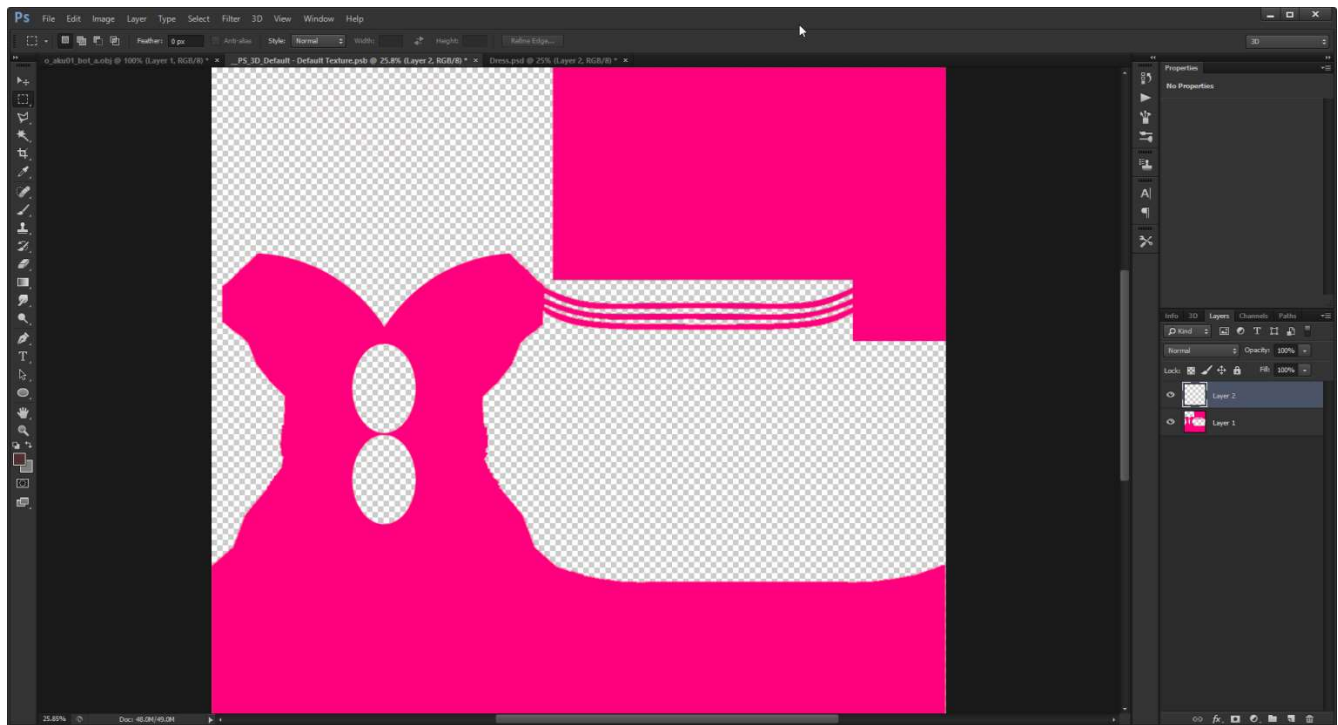

3. Now got to your main texture project (Dress.psd here) copy the main pink texture.

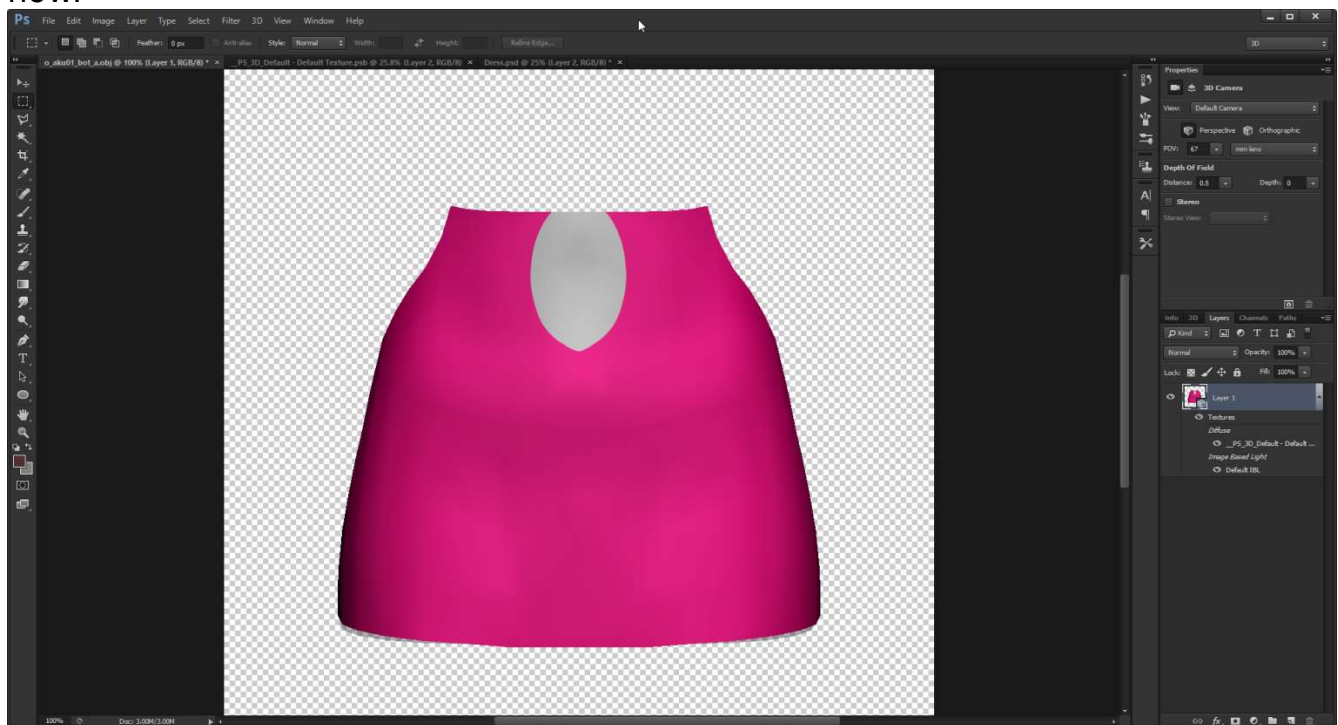

4. Once you have it copied, Switch back to __PS_3D_Default.psb and paste using ctrl+shift+v (this just pastes at exact location as the source copy)

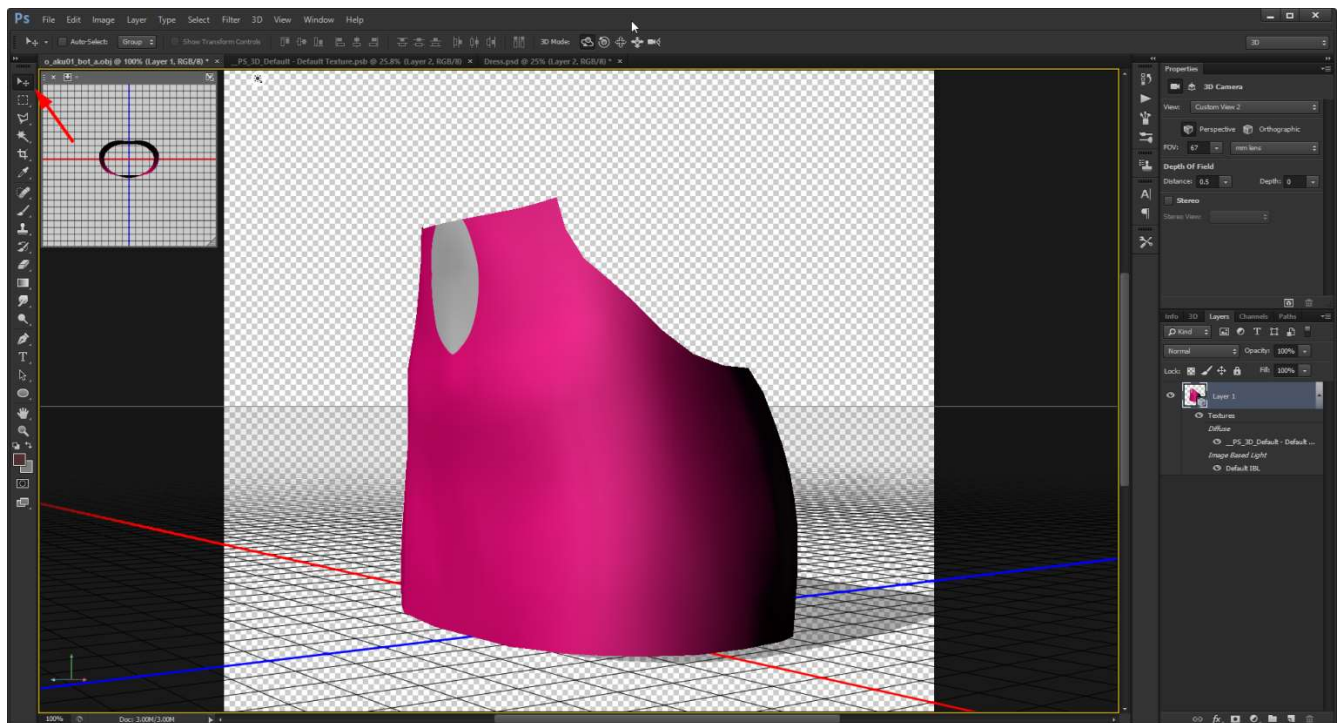

5. Make a new layer (we will be drawing on this layer)

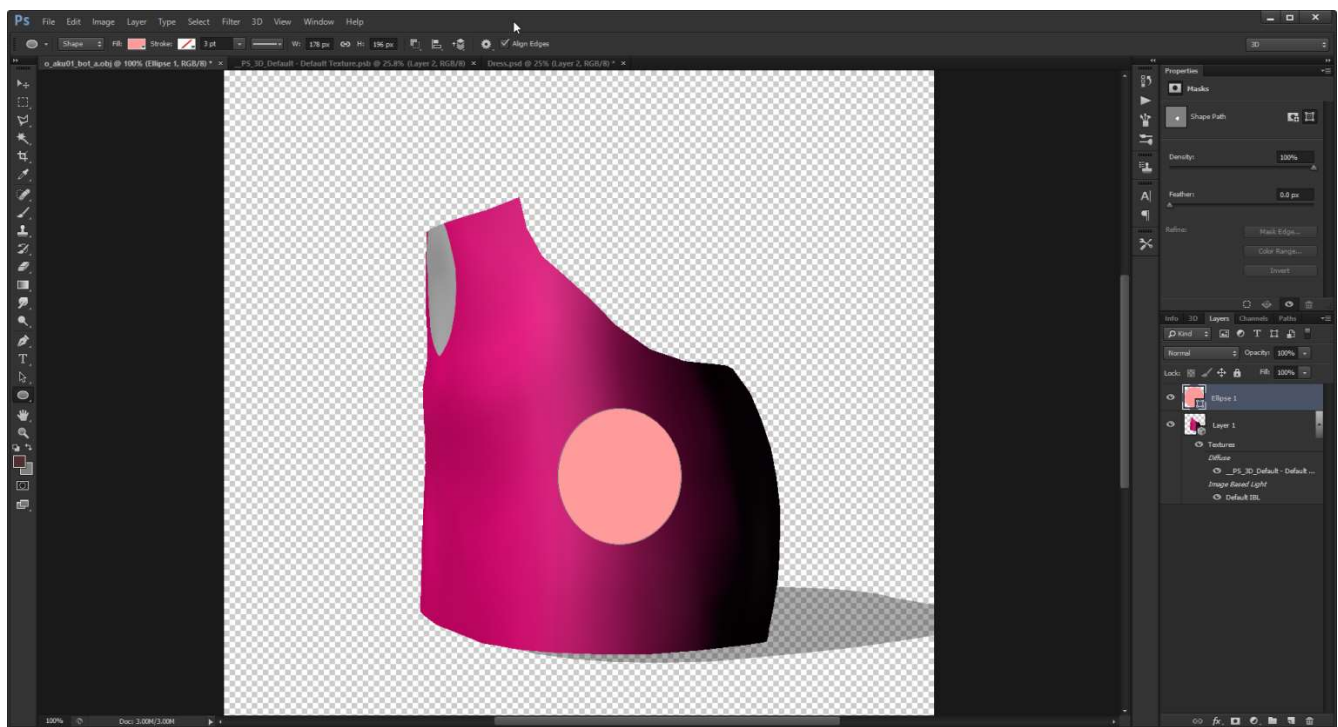

6. Swap back over to o_aku01_bot_a.obj, you should see the texture on the .obj now:

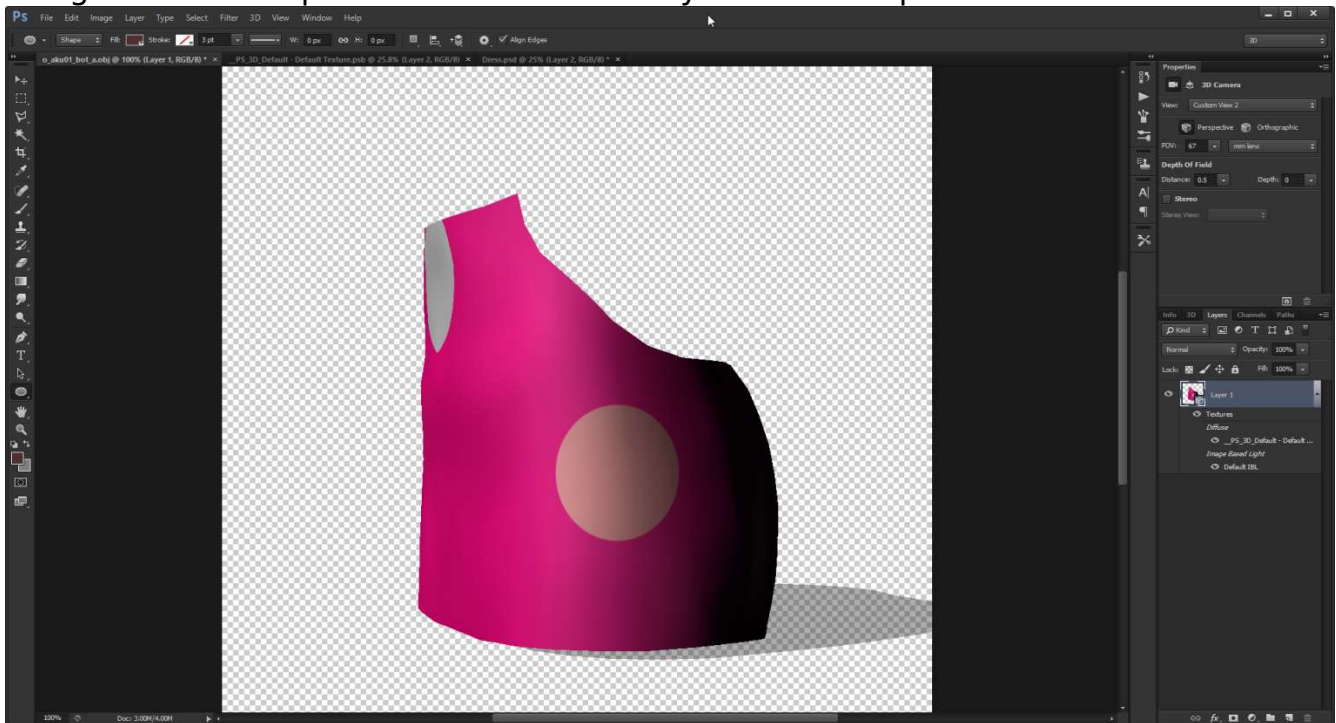

6a. you can move around using this Tool:(edited)

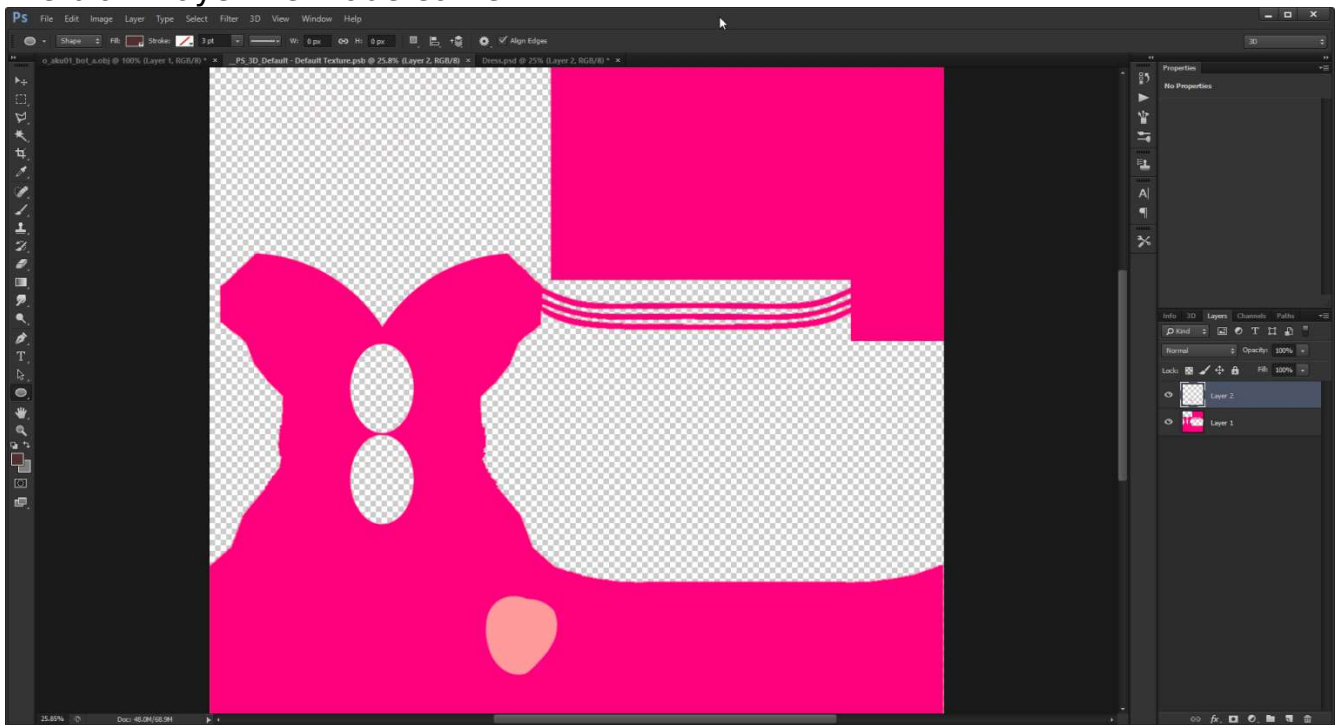

7. From here you can make a shape or paint like this. As you can see it made a new layer shape

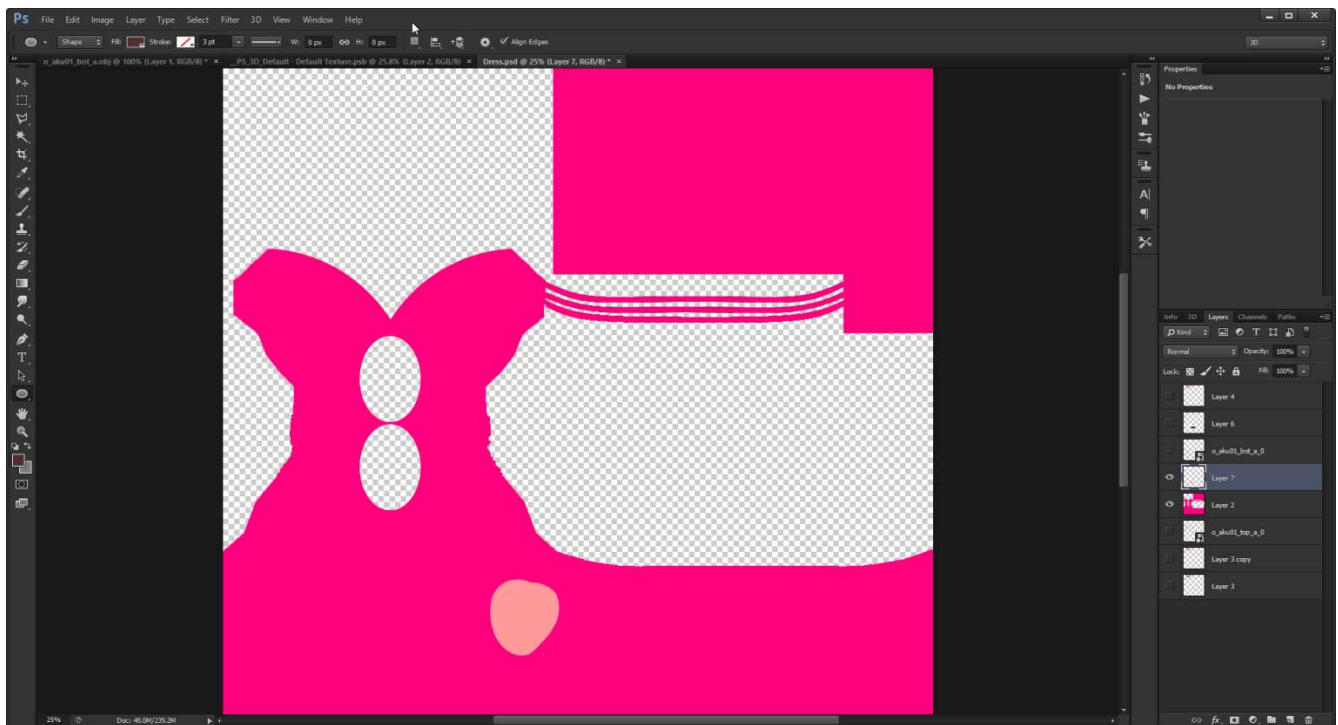

8. Once you have your shape placed right click the ellipse 1 layer, and select merge down. This paints onto the blank layer we made prior:

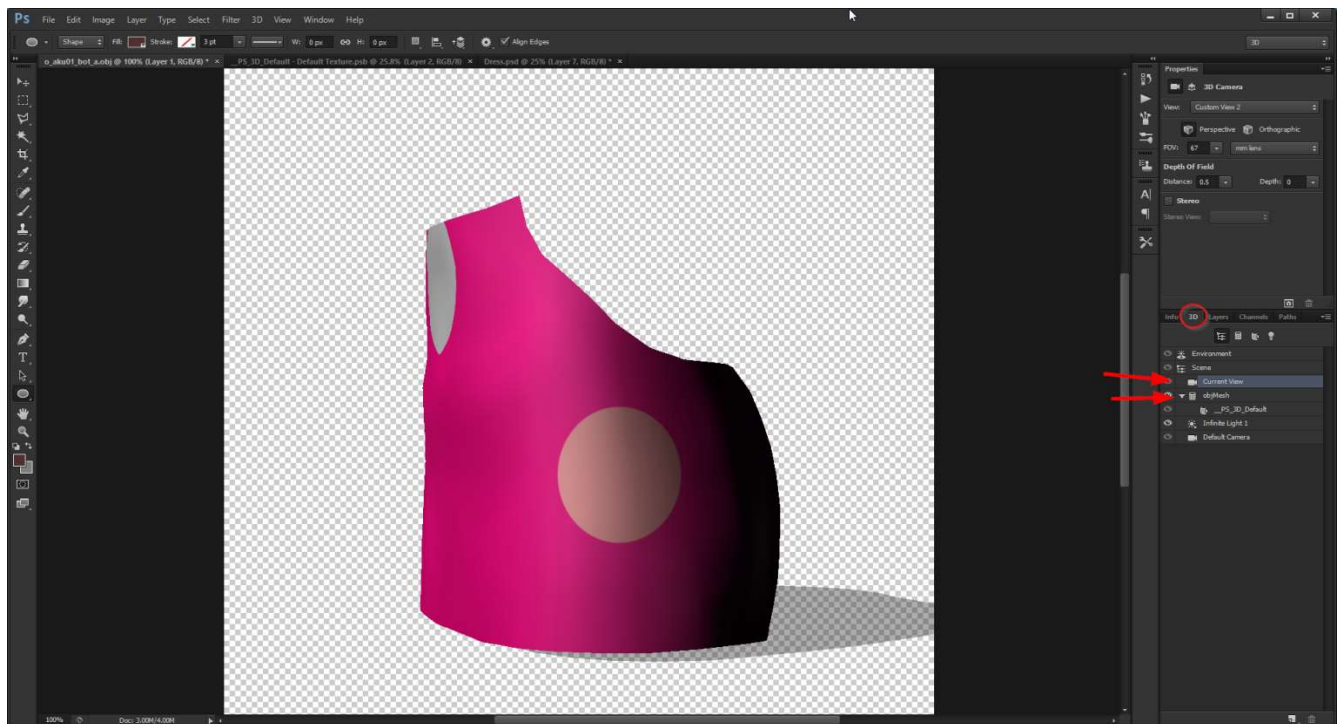

9. If you swap back to _PS_3D_Default Texture.psb, you will now see the shape on the blank layer we made earlier:

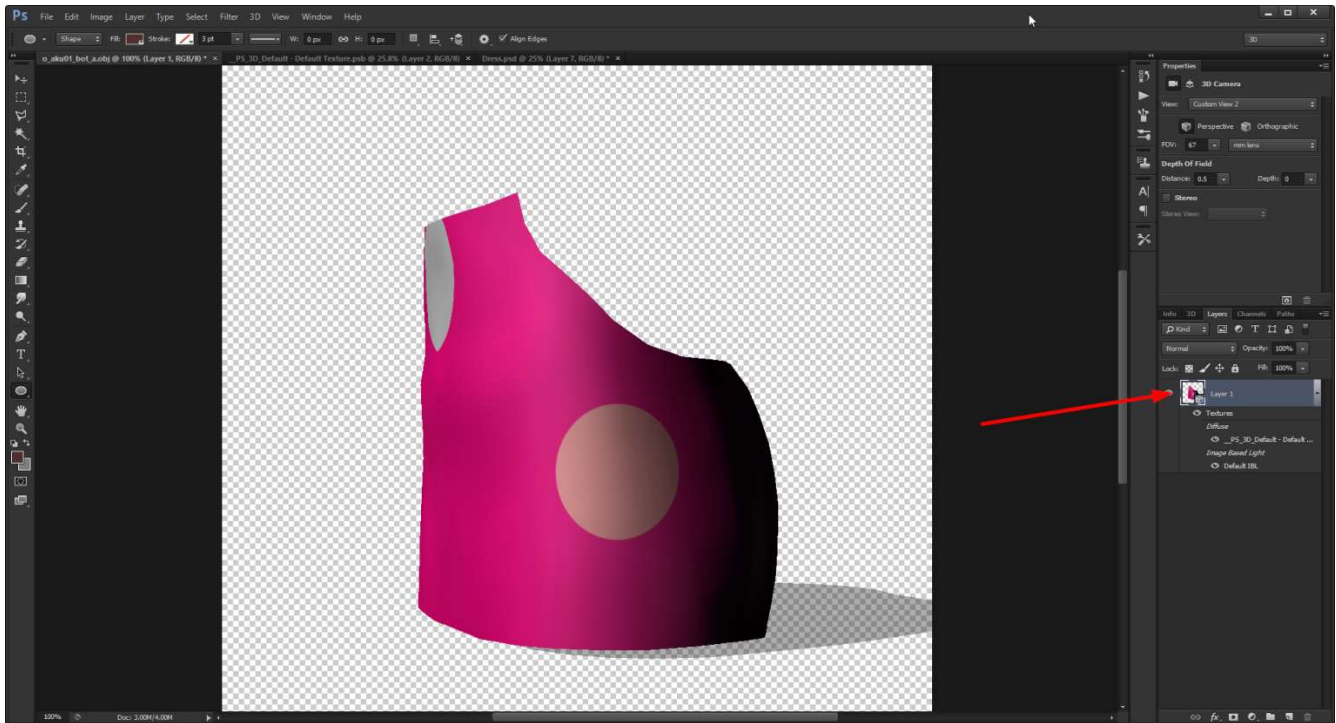

10. now copy this shape and paste into your Dress.Psd file and save as png for koi:

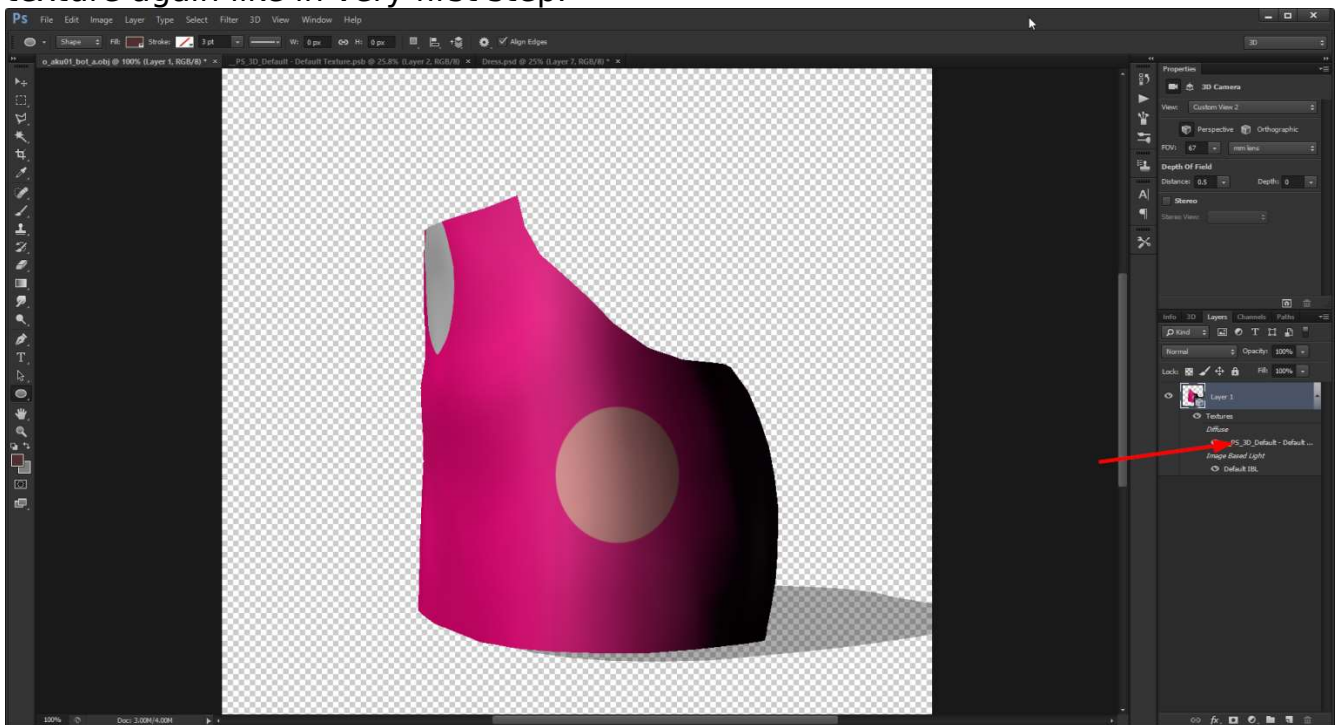

Extra, if you have issues moving in the 3d view, you can click this 3d tab and either select "Current View" or "objMesh" to move around.

Extra, if for some reason your texture is not updating on the model first click the 3d layer:

If it still does not update or change you will need to double click the diffuse texture again like in very first step.

idk if its a bug in my program but that was the work around i found.
